

NT Services

You can create NT services in C++ using ATL through the code generating wizards. That's easy and murky. Actually, after reading an article in WDJ, the october 2000 issue, about IP filters (by Ton Plooy), I realized how simple such services are, in fact. I've read books, too many books, about how to do services, so I had the impression it simply had to be hairy. Well, it doesn't.

Using Ton Plooy's "netblock" program as a guide, I further simplified the code, added a little exception safety, and then presented the whole thing to you, dear invisible reader.

The code doesn't really need much guidance, so I'll drop you off here. Have fun!
